

A Japanese, a Greek and a Dane stand in front of a Pablo Picasso's painting.

A phone in the hand, they observe and admire his work.

A not necessarily abstract scene.

eGuide

A new concept of guided tour

As simple as a phone call...

eGuide is similar to a portable telephone equipped with a standard memory card on which audio information is stored. You can consult it like a simple phone call.

eGuide enables all of your visitors of laying out relevant information and explore your museum or exhibition as they desire. eGuide is an infallible multilingual guide !

Up to 9 languages in the same device.

Much more than a phone...

eGuide is made from electronic components resulting from the most recent technologies.

It is equipped with a powerful ultra miniature memory card offering huge storage capacities up to 1 GB, means 64 hours of message. Very small and very advantageous, these cards are already successfully used in multiple applications such as pocket computers, digital cameras, ...

eGuide is a new way of museum visits and guidance.

Easy contents management...

The cards can be recorded with any PC without any particular hardware or software, except a standard MMC card reader.

To update the contents of eGuide it's enough to withdraw the card. Then place it in the reader, copy the audio files and finally insert it back into the e-Guide. In the same device several languages and two interpretations e.g. adults & children can be stored.

...in a museum

Great autonomy...

The consumption of this device is particularly low. Such a level of consumption enables you to reload it every two days, which increases the lifespan of the batteries. Those are of the latest generation and have an extended life compared to other similar products.

▶ Uninterrupted use	15 hours
▶ Intense real use (50/50)	25 hours
▶ Sporadic real use	34 hours

eGuide in short
